

HETEROARYLALKANOIC ACIDS AS INTEGRIN RECEPTOR  
ANTAGONISTS

5 The present application claims priority under Title 35, United States Code, §119 of United States Provisional application Serial No. 60/211,781 filed June 15, 2000 and United States Provisional application Serial No. 60/211,782 filed June 15, 2000.

Field of the Invention

10 The present invention relates to pharmaceutical agents which are  $\alpha_v\beta_3$  and/or  $\alpha_v\beta_5$  integrin antagonists and as such are useful in pharmaceutical compositions and in methods for treating conditions mediated by  $\alpha_v\beta_3$  and/or  $\alpha_v\beta_5$  integrins.

Background of the Invention

15 The integrin  $\alpha_v\beta_3$  (also known as vitronectin receptor), is a member of the integrin family of heterodimeric transmembrane glycoprotein complexes that mediate cellular adhesion events and signal transduction processes. Integrin  $\alpha_v\beta_3$  is expressed in number of cell types and has been  
20 shown to mediate several biologically relevant processes, including adhesion of osteoclasts to the bone matrix, vascular smooth muscle cell migration and angiogenesis.

The integrin  $\alpha_v\beta_3$  has been shown to play a role in various conditions or disease states including tumor metastasis, solid tumor growth  
25 (neoplasia), osteoporosis, Paget's disease, humoral hypercalcemia of malignancy, osteopenia, angiogenesis, including tumor angiogenesis and lymphangiogenesis, retinopathy including macular degeneration, arthritis, including rheumatoid arthritis, periodontal disease, psoriasis and smooth muscle cell migration (e.g. restenosis arteriosclerosis). The compounds of  
30 the present invention are  $\alpha_v\beta_3$  antagonists and can be used, alone or in combination with other therapeutic agents, in the treatment or modulation of various conditions or disease states described above. Additionally, it has

been found that such agents would be useful as antivirals, antifungals and antimicrobials.

The integrin  $\alpha_v\beta_5$  is thought to play a role in neovascularization. M.C. Friedlander, *et al.*, *Science*, 270, 1500-1502 (1995) disclose that a  
5 monoclonal antibody for  $\alpha_v\beta_5$  inhibits VEGF-induced angiogenesis in the rabbit cornea and the chick chorioallantoic membrane model. Therefore compounds which act as antagonists of the  $\alpha_v\beta_5$  integrin will inhibit neovascularization and will be useful for treating and preventing angiogenesis metastasis, tumor growth, macular degeneration and diabetic  
10 retinopathy.

Certain compounds may antagonize both the  $\alpha_v\beta_5$  and the  $\alpha_v\beta_3$  receptor and therefore are referred to as "mixed  $\alpha_v\beta_5/\alpha_v\beta_3$  antagonists" or "dual  $\alpha_v\beta_3/\alpha_v\beta_5$  antagonists". Such dual or mixed antagonists are useful for  
15 treating or preventing angiogenesis, tumor metastasis, tumor growth, diabetic retinopathy, macular degeneration, atherosclerosis and osteoporosis

It has been shown that the  $\alpha_v\beta_3$  integrin and other  $\alpha_v$  containing integrins bind to a number of Arg-Gly-Asp (RGD) containing matrix macromolecules. Compounds containing the RGD sequence mimic  
20 extracellular matrix ligands so as to bind to cell surface receptors. However, it is also known that RGD peptides in general are non-selective for RGD dependent integrins. For example, most RGD peptides which bind to  $\alpha_v\beta_3$  also bind to  $\alpha_v\beta_5$ ,  $\alpha_v\beta_1$  and  $\alpha_{IIb}\beta_3$ . Antagonism of platelet  $\alpha_{IIb}\beta_3$  (also known as the fibrinogen receptor) is known to block platelet  
25 aggregation in humans. In order to avoid bleeding side-effects when treating the conditions or disease states associated with the integrin  $\alpha_v\beta_3$ , it would be beneficial to develop compounds which are selective antagonists of  $\alpha_v\beta_3$  as opposed to  $\alpha_{IIb}\beta_3$ .

Further, it has not been established in the art that sparing  $\alpha_v\beta_6$   
30 integrin would be a beneficial property to be incorporated in the design of antagonists of  $\alpha_v\beta_3$ . Rather,  $\alpha_v\beta_6$  has been identified as a target for antagonists because it is highly expressed in many carcinoma cell lines, and has been shown to enhance the proliferative capacity of a colon carcinoma

cell line both *in vivo* and *in vitro* (Agrez *et al.*, 1994, *J. Cell Biol.* 127, 547). Additionally,  $\alpha_v\beta_6$  is expressed during the later stages of wound healing and remains expressed until the wound is closed (See Christofidou-Solomidou, *et al.*, 1997 *American J. of Pathol.*, 151, 975), and therefore it is believed

5 that  $\alpha_v\beta_6$  plays a role in the remodeling of the vasculature during the later stages of angiogenesis. Accordingly, antagonists of  $\alpha_v\beta_6$  are seen as useful in treating or preventing cancer by inhibiting tumor growth and metastasis (see, for example, United States Patent 6,211,191).

Tumor cell invasion occurs by a three step process: 1) tumor cell

10 attachment to extracellular matrix; 2) proteolytic dissolution of the matrix; and 3) movement of the cells through the dissolved barrier. This process can occur repeatedly and can result in metastases at sites distant from the original tumor.

Seftor *et al.* (*Proc. Natl. Acad. Sci. USA*, Vol. 89 (1992) 1557-1561)

15 have shown that the  $\alpha_v\beta_3$  integrin has a biological function in melanoma cell invasion. Montgomery *et al.*, (*Proc. Natl. Acad. Sci. USA*, Vol. 91 (1994) 8856-60) have demonstrated that the integrin  $\alpha_v\beta_3$  expressed on human melanoma cells promotes a survival signal, protecting the cells from apoptosis. Mediation of the tumor cell metastatic pathway by interference

20 with the  $\alpha_v\beta_3$  integrin cell adhesion receptor to impede tumor metastasis would be beneficial.

Further, with the discovery that  $\alpha_v\beta_3$  plays a role in the process of lymphatic dissemination via adhesion of melanoma cells to lymph node by binding the vitronectin receptor (Nip *et al.*, *J Clin Invest* 1992, 90, 1406),

25 inhibitors of  $\alpha_v\beta_3$  may also be useful for making alterations in lymphatic endothelial-tumor cell adhesion, thereby further reducing the potential for tumor metastasis.

Brooks *et al.* (*Cell*, Vol. 79 (1994) 1157-1164) have demonstrated that antagonists of  $\alpha_v\beta_3$  provide a therapeutic approach for the treatment of

30 neoplasia (inhibition of solid tumor growth) since systemic administration of  $\alpha_v\beta_3$  antagonists causes dramatic regression of various histologically distinct human tumors.

The compounds of the present invention are useful for the treatment, including prevention of angiogenic disorders. The term angiogenic disorders include conditions involving abnormal neovascularization. The growth of new blood vessels, or angiogenesis, also contributes to pathological conditions such as diabetic retinopathy including macular degeneration (Adamis *et al.*, *Amer. J. Ophthalmol.*, Vol. 118, (1994) 445-450) and rheumatoid arthritis (Peacock *et al.*, *J. Exp. Med.*, Vol. 175, (1992), 1135-1138). Therefore,  $\alpha_v\beta_3$  antagonists would be useful therapeutic agents for treating such conditions associated with neovascularization (Brooks *et al.*, *Science*, Vol. 264, (1994), 569-571).

It has been reported that the cell surface receptor  $\alpha_v\beta_3$  is the major integrin on osteoclasts responsible for attachment to bone (for a review, see Rodan and Rodan, 1997, *J. Endocrinol.* 154, S47, Nakamura *et al.*, *J. Cell Science*, 1999 112, 3985). Osteoclasts cause bone resorption and when such bone resorbing activity exceeds bone forming activity it leads to an increased number of bone fractures, incapacitation and increased mortality. Antagonists of  $\alpha_v\beta_3$  have been shown to be potent inhibitors of osteoclastic activity both *in vitro* (Sato *et al.*, *J. Cell. Biol.*, Vol. 111 (1990) 1713-1723) and *in vivo* (Fisher *et al.*, *Endocrinology*, Vol. 132 (1993) 1411-1413). Antagonism of  $\alpha_v\beta_3$  leads to decreased bone resorption and therefore restores a normal balance of bone forming and resorbing activity. Thus it would be beneficial to provide antagonists of osteoclast  $\alpha_v\beta_3$  which are effective inhibitors of bone resorption and therefore are useful in the treatment or prevention of osteoporosis.

The role of the  $\alpha_v\beta_3$  integrin in smooth muscle cell migration also makes it a therapeutic target for prevention or inhibition of neointimal hyperplasia which is a leading cause of restenosis after vascular procedures (Choi *et al.*, *J. Vasc. Surg.* Vol. 19(1) (1994) 125-34). Prevention or inhibition of neointimal hyperplasia by pharmaceutical agents to prevent or inhibit restenosis would be beneficial.

White (*Current Biology*, Vol. 3(9)(1993) 596-599) has reported that adenovirus uses  $\alpha_v\beta_3$  for entering host cells. The integrin appears to be required for endocytosis of the virus particle and may be required for

### Summary of the Invention

The compounds of this invention are 1)  $\alpha_v\beta_3$  integrin antagonists; or 2)  $\alpha_v\beta_5$  integrin antagonists; or 3) mixed or dual  $\alpha_v\beta_3/\alpha_v\beta_5$  antagonists. The present invention includes compounds which inhibit the  
5    respective integrins and also includes pharmaceutical compositions comprising such compounds. The present invention further provides for methods for treating or preventing conditions mediated by the  $\alpha_v\beta_3$  and/or  $\alpha_v\beta_5$  receptors in a mammal in need of such treatment comprising  
10   administering a therapeutically effective amount of the compounds of the present invention and pharmaceutical compositions of the present invention. Administration of such compounds and compositions of the present invention inhibits angiogenesis, tumor metastasis, tumor growth, osteoporosis, Paget's disease, humoral hypercalcemia of malignancy, retinopathy, macular degeneration, arthritis, periodontal disease, smooth  
15   muscle cell migration, including restenosis and atherosclerosis, and viral diseases.

Further, it has been found that the selective antagonism of the  $\alpha_v\beta_3$  integrin is desirable in that the  $\alpha_v\beta_6$  integrin may play a role in normal physiological processes of tissue repair and cellular turnover that routinely  
20   occur in the skin and pulmonary tissue, and  $\alpha_v\beta_8$  may play a role in the regulation of growth in the human pathway. Therefore, compounds which selectively inhibit the  $\alpha_v\beta_3$  integrin as opposed to the  $\alpha_v\beta_6$  and/or the  $\alpha_v\beta_8$  integrin have reduced side-effects associated with inhibition of the  $\alpha_v\beta_6$  and/or the  $\alpha_v\beta_8$  integrin. It is therefore another object of the present  
25   invention to provide compounds that are selective antagonists of  $\alpha_v\beta_3$  and / or  $\alpha_v\beta_5$  as opposed to  $\alpha_v\beta_6$ , and it is yet another object of the present invention to provide compounds that are selective antagonists of  $\alpha_v\beta_3$  and / or  $\alpha_v\beta_5$  as opposed to  $\alpha_v\beta_8$ .

It is a further object of the present invention to provide methods for  
30   treating or preventing conditions mediated by the  $\alpha_v\beta_3$  and/or  $\alpha_v\beta_5$  receptors in a patient in need of such treatment using compounds that have selectivity for the  $\alpha_v\beta_3$  and/or  $\alpha_v\beta_5$  integrin over the  $\alpha_v\beta_6$  integrin.

The compounds as shown above can exist in various isomeric forms and all such isomeric forms are meant to be included. Tautomeric forms are also included as well as pharmaceutically acceptable salts of such isomers and tautomers.

In the structures and formulas herein, a bond drawn across a bond of a ring can be to any available atom on the ring.

The term "pharmaceutically acceptable salt" refers to a salt prepared by contacting a compound of Formula I with an acid whose anion is generally considered suitable for human consumption. For use in medicine, the salts of the compounds of this invention are non-toxic "pharmaceutically acceptable salts." Salts encompassed within the term "pharmaceutically acceptable salts" refer to non-toxic salts of the compounds of this invention which are generally prepared by reacting the free base with a suitable organic or inorganic acid. Representative salts include the following: benzenesulfonate, hydrobromide and hydrochloride. Furthermore, where the compounds of the invention carry an acidic moiety, suitable pharmaceutically acceptable salts thereof may include alkali metal salts, e.g., sodium or potassium salts; alkaline earth metal salts, e.g., calcium or magnesium salts; and salts formed with suitable organic ligands, e.g., quaternary ammonium salts. All of the pharmacologically acceptable salts may be prepared by conventional means. (See Berge *et al.*, *J Pharm. Sci.*, 66(1), 1-19 (1977) for additional examples of pharmaceutically acceptable salts.)

The compounds of the present invention can have chiral centers and occur as racemates, racemic mixtures, diastereomeric mixtures, and as individual diastereomers or enantiomers, with all isomeric forms included in the present invention. Therefore, where a compound is chiral, the separate enantiomers or diastereomers, substantially free of the other, are included within the scope of the present invention; further included are all mixtures of the enantiomers or diastereomers. Also included within the scope of the invention are polymorphs, or hydrates or other modifiers of the compounds of invention.

For the selective inhibition or antagonism of  $\alpha_v\beta_3$  and/or  $\alpha_v\beta_5$  integrins, compounds of the present invention may be administered orally, parenterally, or by inhalation spray, or topically in unit dosage formulations containing conventional pharmaceutically acceptable carriers, adjuvants and vehicles. The term parenteral as used herein includes, for example, subcutaneous, intravenous, intramuscular, intrasternal, transmuscular infusion techniques or intraperitoneally.

30           Accordingly, the present invention provides a method of treating conditions mediated by selectively inhibiting or antagonizing the  $\alpha_v\beta_3$  and/or  $\alpha_v\beta_5$  cell surface receptor which method comprises administering a therapeutically effective amount of a compound selected from the class of

compounds depicted in the above formulas, wherein one or more compound is administered in association with one or more non-toxic, pharmaceutically acceptable carriers and/or diluents and/or adjuvants (collectively referred to herein as "carrier" materials) and if desired other

5 active ingredients.

In another embodiment, the present invention provides a method for selective antagonism of the  $\alpha_v\beta_3$  and/or  $\alpha_v\beta_5$  cell surface receptors over  $\alpha_{IIb}\beta_3$ , and in a further embodiment, also over the  $\alpha_v\beta_6$  integrin receptor.

It has not been recognized that inhibitors of  $\alpha_v\beta_3$  or  $\alpha_v\beta_5$  should

10 possess selectivity based on the  $\beta$ -integrin. However, evidence of the toxicity of  $\beta_6$  integrin antagonism indicates that it may be beneficial to spare antagonism of  $\beta_6$  when designing  $\alpha_v\beta_3$  antagonists.

The inhibition of the integrin  $\alpha_v\beta_6$  has been found to result in the decreased activation of endogenous TGF- $\beta$ 1 with loss of its negative

15 immunoregulatory properties, and thus causes inflammatory infiltrates to aggregate in many tissues, causing inflammatory lesions and fibrosis (Munger *et al.* 1999, *Cell* 96, 319). Targeted disruption of the TGF- $\beta$ 1 gene in mice results in marked infiltration of inflammatory cells in multiple tissues (including the lungs), and  $\alpha_v\beta_6$  appears to be an essential regulator of TGF-

20  $\beta$ 1 activation in the lungs (Shull *et al.* 1992, *Nature* 359, 693, Kulkarni *et al.*, 1993 *Proc Natl Acad Sci. USA* 90, 770). This observation is further supported by the fact that mice with a targeted disruption of the  $\beta_6$  gene have inflammatory infiltrates in the skin and lungs (Böttinger *et al.* 1997, *Kidney Int.* 51, 1355). Table 1 provides examples of compounds that exhibit

25 selectivity of  $\alpha_v\beta_3$  over  $\alpha_v\beta_6$ . Table 1 further provides examples of compounds that exhibit selectivity of  $\alpha_v\beta_3$  over  $\alpha_{IIb}\beta_3$ .

Selectivite inhibition refers to a selectivity ratio of at least 10, more preferably 50, and even more preferably of at least 100. Selectivity ratio refers to the selectivity of the IC<sub>50</sub> of  $\alpha_v\beta_6$  or  $\alpha_{IIb}\beta_3$  over the selectivity of the

30 IC<sub>50</sub> of  $\beta_3$ .

It is another object of the present invention to provide methods for treating or preventing conditions mediated by the  $\alpha_v\beta_3$  and/or  $\alpha_v\beta_5$  receptors in a mammal in need of such treatment using compounds that

5 have selectivity for the  $\alpha_v\beta_3$  and/or  $\alpha_v\beta_5$  integrin over the  $\alpha_v\beta_6$  integrin.

The present invention provides a method for inhibiting bone resorption, treating osteoporosis, inhibiting humoral hypercalcemia of malignancy, treating Paget's disease, inhibiting tumor metastasis, inhibiting neoplasia (solid tumor growth), inhibiting angiogenesis including tumor

10 angiogenesis, treating retinopathy including macular degeneration and diabetic retinopathy, inhibiting arthritis, psoriasis and periodontal disease, and inhibiting smooth muscle cell migration including restenosis.

Based upon standard laboratory experimental techniques and procedures well known and appreciated by those skilled in the art, as well

15 as comparisons with compounds of known usefulness, the compounds of Formula I can be used in the treatment of patients suffering from the above pathological conditions. One skilled in the art will recognize that selection of the most appropriate compound of the invention is within the ability of one with ordinary skill in the art and will depend on a variety of factors including

20 assessment of results obtained in standard assay and animal models.

Some *in vivo* models of angiogenesis include the CAM (chick chorioallantoic membrane) assay (Vu *et al.*, *Lab Invest.* 1985, 53, 4), the gelatin sponge/chorioallantoic membrane assay (Ribatti *et al.*, *J. Vasc. Res.* 1997, 34, 6), the rabbit corneal micropocket assay (Gimbrone *et al.*, *J Natl*

25 *Cancer Inst* 52, 413) and the insertion of tumor cells in mice (Robertson *et al.*, *Cancer Res.* 1999, 51, 1339). For a review of angiogenesis assays, see Auerbach *et al.*, *Pharmacol Ther* 1991, 51, 1.

Treatment of a patient afflicted with one of the pathological conditions comprises administering to such a patient an amount of compound of the

30 Formula I which is therapeutically effective in controlling the condition or in prolonging the survivability of the patient beyond that expected in the absence of such treatment. As used herein, the term "inhibition" of the condition refers to slowing, interrupting, arresting or stopping the condition and does not necessarily indicate a total elimination of the condition. It is

believed that prolonging the survivability of a patient, beyond being a significant advantageous effect in and of itself, also indicates that the condition is beneficially controlled to some extent.

As stated previously, the compounds of the invention can be used in a variety of biological, prophylactic or therapeutic areas. It is contemplated that these compounds are useful in prevention or treatment of any disease state or condition wherein the  $\alpha_v\beta_3$  and/or  $\alpha_v\beta_5$  integrin plays a role.

The compounds of the invention may also be used in combination therapies. For instance, an  $\alpha_v\beta_3$  inhibitor may be administered with a cytotoxic agent such as a toxin, radionuclide, or a chemotherapeutic to promote tumor regression.

The dosage regimen for the compounds and/or compositions containing the compounds is based on a variety of factors, including the type, age, weight, sex and medical condition of the patient; the severity of the condition; the route of administration; and the activity of the particular compound employed. Thus the dosage regimen may vary widely. Dosage levels of the order from about 0.01 mg to about 100 mg per kilogram of body weight per day are useful in the treatment of the above-indicated conditions.

Oral dosages of the present invention, when used for the indicated effects, will range between about 0.01 mg per kg of body weight per day (mg/kg/day) to about 100 mg/kg/day, preferably 0.01 to 10 mg/kg/day, and most preferably 0.1 to 1.0 mg/kg/day. For oral administration, the compositions are preferably provided in the form of tablets containing 0.01, 0.05, 0.1, 0.5, 1.0, 2.5, 5.0, 10.0, 15.0, 25.0, 50.0, 100, 200 and 500 milligrams of the active ingredient for the symptomatic adjustment of the dosage to the patient to be treated. A medicament typically contains from about 0.01 mg to about 500 mg of the active ingredient, preferably, from about 1mg to about 100 mg of active ingredient. Intravenously, the most preferred doses will range from about 0.1 to about 10 mg/kg/minute during a constant rate infusion. Advantageously, compounds of the present invention may be administered in a single daily dose, or the total daily dosage may be administered in divided doses of two, three or four times daily. Furthermore, preferred compounds for the present invention can be

administered in intranasal form via topical use of suitable intranasal vehicles, or via transdermal routes, using those forms of transdermal skin patches well known to those of ordinary skill in the art. To be administered in the form of a transdermal delivery system, the dosage administration will, of course, be continuous rather than intermittent throughout the dosage regiment.

For administration to a mammal in need of such treatment, the compounds in a therapeutically effective amount are ordinarily combined with one or more adjuvants appropriate to the indicated route of administration. The compounds may be admixed with lactose, sucrose, starch powder, cellulose esters of alkanolic acids, cellulose alkyl esters, talc, stearic acid, magnesium stearate, magnesium oxide, sodium and calcium salts of phosphoric and sulphuric acids, gelatin, acacia, sodium alginate, polyvinylpyrrolidone, and/or polyvinyl alcohol, and tableted or encapsulated for convenient administration. Alternatively, the compounds may be dissolved in water, polyethylene glycol, propylene glycol, ethanol, corn oil, cottonseed oil, peanut oil, sesame oil, benzyl alcohol, sodium chloride, and/or various buffers. Other adjuvants and modes of administration are well and widely known in the pharmaceutical art.

The pharmaceutical compositions useful in the present invention may be subjected to conventional pharmaceutical operations such as sterilization and/or may contain conventional pharmaceutical adjuvants such as preservatives, stabilizers, wetting agents, emulsifiers, buffers, etc.

The general synthetic sequences for preparing the compounds useful in the present invention are outlined in Schemes 1-12. Both an explanation of, and the actual procedures for, the various aspects of the present invention are described where appropriate. The following Schemes and Examples are intended to be merely illustrative of the present invention, and not limiting thereof in either scope or spirit. Those with skill in the art will readily understand that known variations of the conditions and processes described in the Schemes and Examples can be used to synthesize the compounds of the present invention.

5           The compounds of formula  $A_{13}$ , wherein the ring A is preferentially a 6-member heteroaryl or a bicyclic heteroaryl, can be prepared by reacting an intermediate of formula  $A_{11}$  with a compound of the formula  $A_{12}$ . For example, when  $Z_3$  is OH, SH or NHR,  $A_{12}$  may be alkylated with  $A_{11}$  ( $Z_4 = \text{Br}$  or OMs) using base such as (sodium hydride, potassium hydride) preferably  
10 in a solvent such as dimethylsulfoxide or DMF. These reactions may preferentially be carried at 0 °C to approx. 40 °C. Alternately, when  $Z_3$  and  $Z_4$  are both OH, the ether formation to product  $A_{13}$  may be accomplished by using Mitsunobu reaction. This reaction may preferentially be carried out using triarylphosphine (such as triphenylphosphine) and azodicarboxylate  
15 (such as diethyl azodicarboxylate, di-tert-butyl azodicarboxylate, diisopropyl azodicarboxylate) in solvents such as DMF, methylene chloride, THF and the like. When  $Z_3$  carries a carboxylic acid and  $Z_4$  is an amine, the standard coupling conditions may be used to synthesize the carboxamide (CONH) containing targets  $A_{13}$

20           Alternately, the compounds of formula  $A_{13}$  may be prepared by starting with compounds of general formula  $A_{14}$ . For example, when  $Z_5$  in  $A_{14}$  is  $\text{NH}_2$ , cyclic or acyclic guanidino containing compounds of formula  $A_{13}$  may be synthesized by adopting the methodologies discussed in e. g. U. S. Patent 5,852, 210, U. S. Patent 5,773,646. Similarly, compounds of formula  
25  $A_{14}$  ( $Z_5 = \text{CHO}$ ) may be treated with amino containing heteroaromatic system (such as 2-aminopyridine) to give the target compounds  $A_{13}$ . This reaction may preferentially be carried out by reductive amination procedures using reducing agents such as sodium triacetoxyborohydride, sodium cyanoborohydride or sodium borohydride.

SCHEME 2

Compounds of the formula  $A_{18}$  containing an oxadiazole ring may be prepared by starting with intermediates  $A_{15}$ . The reaction of  $A_{15}$  with hydroxylamine hydrochloride in the presence of base (such as sodium methoxide, sodium ethoxide) using solvents such as methanol, ethanol gives the amidoxime intermediate  $A_{16}$ . The reaction of  $A_{16}$  with a carboxylic acid containing intermediate  $A_{17}$  in the presence of a coupling reagent such as carbonyldiimidazole gives the compounds of formula  $A_{18}$ .

SCHEME 3

Intermediates of the formula  $A_{15}$  (scheme 2), containing a heteroarylamine can be prepared as shown in scheme 3. The reductive amination of arylamine ( $A_{19}$ ) with an aliphatic aldehyde ( $A_{20}$ ) gives the intermediate  $A_{15}$  containing the aliphatic chain. This reaction may preferentially be carried out by using sodium triacetoxyborohydride, sodium cyanoborohydride or sodium borohydride as reducing agent and using methylene chloride, ethyl alcohol or tetrahydrofuran as solvent. Commercially accessible heteroarylamine such as 2-aminopyridine could be used directly. In certain cases, protected heteroaryls such as imidazole and pyrazole derived amines may be used as shown above. The reaction described in scheme 3 may also be used to synthesize other variants of  $Z_1$ - $Z_2$  in  $A_{15}$  (scheme 2)

The residue was dissolved in ethyl acetate, passed through a pad of silica, concentrated, and used directly in next reaction. Mass Spectrum: (MH<sup>+</sup>) = 231.

**Step 5 :**

Methyl 5-hydroxypentanoate

This compound was synthesized following the procedure of: Fleming, I.; Higgins, D.; Journal Chemical Society Perkin Trans. 1, 1998, 17, 2673-2678.

**Step 6:**

Methyl 5-oxopentanoate

This compound was synthesized following the procedure of: Fleming, I.; Higgins, D.; Journal Chemical Society Perkin Trans. 1, 1998, 17, 2673-2678.

Step 7:

Methyl 5-(pyridin-2-ylamino)pentanoate

To a solution of methyl 5-oxopentanoate (3.0 g, 23 mmol) in methylene chloride (75 mL) was added 2-aminopyridine (2.38 g, 25.3 mmol). The mixture was stirred at room temperature for 30 minutes. Then, the sodium triacetoxy borohydride (7.31 g, 34.5 mmol) was added and the mixture was stirred at room temperature for 4.5 hours. A saturated solution of sodium bicarbonate (40 mL) was added and the reaction mixture was extracted with ether (4x 30 mL). The organic layer was washed with 0.1N NaOH, water (2x 40 mL), dried (MgSO<sub>4</sub>) and concentrated. The residue was purified by flash chromatography 1:1 (Acetone: methylene chloride) to obtain 2.31 g (48%) of the product. <sup>1</sup>H NMR (CDCl<sub>3</sub>) 8.09-8.06 (m, 1H), 7.42-7.38 (m, 1H), 6.59-6.52 (m, 1H), 6.37 (d, J = 9 Hz, 1H), 4.52 (br s, 1H), 3.68 (s, 3H), 3.29 (q, J = 6 Hz, 2H), 2.40-2.31 (m, 2H), 1.8-1.61 (m, 4H).

Step 8:

Methyl 5-[(tert-butoxycarbonyl)(pyridin-2-yl)amino]pentanoate

To a mixture of methyl 5-(pyridin-2-ylamino)pentanoate (300 mg, 1.44 mmol) in methylene chloride (10 mL) was added DMAP (17.6 mg, 0.144 mmol) and di-tert-butyl dicarbonate (1.57 g, 7.2 mmol). The mixture was stirred at room temperature overnight. The reaction was diluted with water and the organic layer separated, dried (MgSO<sub>4</sub>), and concentrated. The residue was purified by flash chromatography 1:2 (ethyl acetate:hexane) to obtain 213 mg (48%) of the product as a colorless oil. <sup>1</sup>H NMR (CDCl<sub>3</sub>) 8.36-8.34 (m, 1H), 7.65-7.55 (m, 2H), 7.02-6.98 (m, 1H), 3.97-3.92 (m, 2H), 3.65 (s, 3H), 2.36-2.30 (m, 2H), 1.67-1.62 (m, 4H), 1.51 (s, 9H).

**Step 9:**

5-[(tert-butoxycarbonyl)(pyridin-2-yl)amino]pentanoic acid

NaOH (240 mg, 6 mmol) was dissolved in water (3 mL) and MeOH (10 mL). This solution was added to methyl 5-[(tert-butoxycarbonyl)(pyridin-2-yl)amino]pentanoate (200 mg, 0.64 mmol) dissolved in MeOH (15 mL). The mixture was stirred at room temperature overnight. The reaction mixture was neutralized with 2N HCl to pH 7. The solvent was removed under reduced pressure. A citric acid solution (10 mL) was added and the mixture was extracted with ethyl acetate, dried (MgSO<sub>4</sub>) and concentrated to give 128 mg (68%) of the product. <sup>1</sup>H NMR (CDCl<sub>3</sub>) 8.36-8.34 (m, 1H), 7.65-7.52 (m, 2H), 7.02-6.98 (m, 1H), 3.97-3.91 (m, 2H), 2.38-2.32 (m, 2H), 1.69-1.62 (m, 4H), 1.50 (s, 9H).

**Step 10:**

3,3-dimethyl-4-{5-[4-(pyridin-2-ylamino)butyl]-1,2,4-oxadiazol-3-yl}butanoic acid trifluoroacetate

5-[(Tert-butoxycarbonyl)(pyridin-2-yl)amino]pentanoic acid (128 mg, 0.44 mmoles) was dissolved in DMF (4 ml) and carbonyldiimidazole (71 mg, 0.64 mmoles) was added. The mixture was stirred at room temperature for 30 minutes and then tert-butyl-5-amino-5-(hydroxyimino)-3,3-dimethylpentanoate (151 mg, 0.66 mmoles) was added. The mixture was stirred at room temperature overnight. Then, the solvent was removed under reduced pressure, the residue was dissolved in ethyl acetate, and passed through a pad of silica. The ethyl acetate was removed under reduced pressure and the residue was dissolved in dioxane (5 mL). The mixture was heated at 90°C overnight. LC/MS: (MH<sup>+</sup>) = 489. The solvent was removed and the residue was purified by flash chromatography 7:3 (hexane: ethyl acetate). The desired fractions were combined and the residue was dissolved in a 7:3 mixture of trifluoroacetic acid: methylene chloride (10 mL) and stirred at room temperature for one hour. The solvent was removed to give 70 mg(36%) of the desired product. <sup>1</sup>H NMR (DMSO-d<sub>6</sub>) 8.82 (br s, 1H), 7.92-7.84 (m, 2H), 7.04 (d, J = 9.5 Hz, 1H), 6.88-6.81 (m, 1H), 3.39-3.30 (m, 2H), 2.97 (t, J = 6 Hz, 2H), 2.75 (s, 2H), 2.25 (s, 2H), 1.87-1.78 (m, 2H), 1.70-1.60 (m, 2H), 1.01 (s, 6H). Mass Spectrum: (MH<sup>+</sup>) = 333.

The activity of the compounds of the present invention was tested in the following assays. Compounds of the present invention antagonize the  $\alpha_v\beta_3$  integrin with an  $IC_{50}$  between 0.1nM to 100  $\mu$ M in the 293-cell assay. Similarly these compounds antagonize the  $\alpha_v\beta_5$  integrin with an  $IC_{50}$  of < 50  $\mu$ M in the cell adhesion assay.

### VITRONECTIN ADHESION ASSAY

#### MATERIALS

Human vitronectin receptors  $\alpha_v\beta_3$  and  $\alpha_v\beta_5$  were purified from human placenta as previously described [Pytela et al., Methods in Enzymology, 144:475-489 (1987)]. Human vitronectin was purified from fresh frozen plasma as previously described [Yatohgo et al., Cell Structure and Function, 13:281-292 (1988)]. Biotinylated human vitronectin was prepared by coupling NHS-biotin from Pierce Chemical Company (Rockford, IL) to purified vitronectin as previously described [Charo et al., J. Biol. Chem., 266(3):1415-1421 (1991)]. Assay buffer, OPD substrate tablets, and RIA grade BSA were obtained from Sigma (St. Louis, MO). Anti-biotin antibody was obtained from Sigma (St. Louis, MO). Nalge Nunc-Immuno microtiter plates were obtained from Nalge Company (Rochester, NY).

#### METHODS

##### Solid Phase Receptor Assays

This assay was essentially the same as previously reported [Niiya et al., Blood, 70:475-483 (1987)]. The purified human vitronectin receptors  $\alpha_v\beta_3$  and  $\alpha_v\beta_5$  were diluted from stock solutions to 1.0  $\mu$ g/mL in Tris-buffered saline containing 1.0 mM  $Ca^{++}$ ,  $Mg^{++}$ , and  $Mn^{++}$ , pH 7.4 (TBS $^{+++}$ ). The diluted receptors were immediately transferred to Nalge Nunc-Immuno microtiter plates at 100  $\mu$ L/well (100 ng receptor/well). The plates were

sealed and incubated overnight at 4°C to allow the receptors to bind to the wells. All remaining steps were at room temperature. The assay plates were emptied and 200 µL of 1% RIA grade BSA in TBS<sup>+++</sup> (TBS<sup>+++</sup>/BSA) were added to block exposed plastic surfaces. Following a 2 hour incubation, the assay plates were washed with TBS<sup>+++</sup> using a 96 well plate washer. Logarithmic serial dilution of the test compound and controls were made starting at a stock concentration of 2 mM and using 2 nM biotinylated vitronectin in TBS<sup>+++</sup>/BSA as the diluent. This premixing of labeled ligand with test (or control) ligand, and subsequent transfer of 50 µL aliquots to the assay plate was carried out with a CETUS Propette robot; the final concentration of the labeled ligand was 1 nM and the highest concentration of test compound was  $1.0 \times 10^{-4}$  M. The competition occurred for two hours after which all wells were washed with a plate washer as before. Affinity purified horseradish peroxidase labeled goat anti-biotin antibody was diluted 1:2000 in TBS<sup>+++</sup>/BSA and 125 µL was added to each well. After 45 minutes, the plates were washed and incubated with OPD/H<sub>2</sub>O<sub>2</sub> substrate in 100 mM/L Citrate buffer, pH 5.0. The plate was read with a microtiter plate reader at a wavelength of 450 nm and when the maximum-binding control wells reached an absorbance of about 1.0, the final A<sub>450</sub> were recorded for analysis. The data were analyzed using a macro written for use with the EXCEL spreadsheet program. The mean, standard deviation, and %CV were determined for duplicate concentrations. The mean A<sub>450</sub> values were normalized to the mean of four maximum-binding controls (no competitor added)(B-MAX). The normalized values were subjected to a four parameter curve fit algorithm [Rodbard et al., Int. Atomic Energy Agency, Vienna, pp 469 (1977)], plotted on a semi-log scale, and the computed concentration corresponding to inhibition of 50% of the maximum binding of biotinylated vitronectin (IC<sub>50</sub>) and corresponding R<sup>2</sup> was reported for those compounds exhibiting greater than 50% inhibition at the highest concentration tested; otherwise the IC<sub>50</sub> is reported as being greater than the highest concentration tested. β-[[2-[[5-[(aminoiminomethyl)amino]-1-oxopentyl]amino]-1-oxoethyl]amino]-3-pyridinepropanoic acid [US 5,602,155

Example 1] which is a potent  $\alpha_v\beta_3$  antagonist ( $IC_{50}$  in the range 3-10 nM) was included on each plate as a positive control.

### PURIFIED IIb/IIIa RECEPTOR ASSAY

#### MATERIALS

Human fibrinogen receptor (IIb/IIIa) was purified from outdated platelets. (Pytela, R., Pierschbacher, M.D., Argraves, S., Suzuki, S., and Rouslahti, E. Biotinylated human vitronectin was prepared by coupling NHS-biotin from Pierce Chemical Company (Rockford, IL) to purified vitronectin as previously described. (Charo, I.F., Nannizzi, L., Phillips, D.R., Hsu, M.A., Scarborough, R.M., "Inhibition of fibrinogen binding to GP IIb/IIIa by a GP IIIa peptide", J. Biol. Chem. 266(3)(1991): 1415-1421.) Assay buffer, OPD substrate tablets, and RIA grade BSA were obtained from Sigma (St. Louis, MO). Anti-biotin antibody was obtained from Sigma (St. Louis, MO). Nalge Nunc-Immuno microtiter plates were obtained from (Rochester, NY). ADP reagent was obtained from Sigma (St. Louis, MO).

#### METHODS

##### Solid Phase Receptor Assays

This assay is essentially the same reported in Niiya, K., Hodson, E., Bader, R., Byers-Ward, V. Koziol, J.A., Plow, E.F. and Ruggeri, Z.M., "Increased surface expression of the membrane glycoprotein IIb/IIIa complex induced by platelet activation: Relationships to the binding of fibrinogen and platelet aggregation", Blood 70(1987):475-483. The purified human fibrinogen receptor (IIb/IIIa) was diluted from stock solutions to 1.0  $\mu\text{g/mL}$  in Tris-buffered saline containing 1.0 mM  $\text{Ca}^{++}$ ,  $\text{Mg}^{++}$ , and  $\text{Mn}^{++}$ , pH

#### Human Platelet Rich Plasma Assays

Healthy aspirin free donors were selected from a pool of volunteers. The harvesting of platelet rich plasma and subsequent ADP induced platelet aggregation assays were performed as described in Zucker, M.B., "Platelet Aggregation Measured by the Photometric Method", Methods in Enzymology 169(1989):117-133. Standard venipuncture techniques using a butterfly allowed the withdrawal of 45 mL of whole blood into a 60 mL syringe containing 5 mL of 3.8% trisodium citrate. Following thorough mixing in the syringe, the anti-coagulated whole blood was transferred to a 50 mL conical polyethylene tube. The blood was centrifuged at room temperature for 12 minutes at 200 xg to sediment non-platelet cells. Platelet rich plasma was removed to a polyethylene tube and stored at room temperature until used. Platelet poor plasma was obtained from a second centrifugation of the remaining blood at 2000 xg for 15 minutes. Platelet counts are typically 300,000 to 500,000 per microliter. Platelet rich plasma (0.45 mL) was aliquoted into siliconized cuvettes and stirred (1100 rpm) at 37°C for 1 minute prior to adding 50 uL of pre-diluted test compound. After 1 minute of mixing, aggregation was initiated by the addition of 50 uL of 200 uM ADP. Aggregation was recorded for 3 minutes in a Payton dual channel aggregometer (Payton Scientific, Buffalo, NY). The percent inhibition of maximal response (saline control) for a series of test compound dilutions was used to determine a dose response curve. All compounds were tested in duplicate and the concentration of half-maximal inhibition ( $IC_{50}$ ) was calculated graphically from the dose response curve for those compounds which exhibited 50% or greater inhibition at the highest concentration tested; otherwise, the  $IC_{50}$  is reported as being greater than the highest concentration tested.

### Cell Assays for Potency and Selectivity

While the  $\beta_3$  subunit of  $\alpha_v\beta_3$  is only known to complex with  $\alpha_v$  or  $\alpha_{1b}$ , the  $\alpha_v$  subunit complexes with multiple  $\beta$  subunits. The three  $\alpha_v$  integrins most homologous with  $\alpha_v\beta_3$  are  $\alpha_v\beta_1$ ,  $\alpha_v\beta_5$  and  $\alpha_v\beta_6$ , with 43%, 56% and 47 % amino acid identity in the  $\beta$  subunits, respectively. To evaluate the selectivity of compounds between the integrins  $\alpha_v\beta_3$  and  $\alpha_v\beta_6$ , cell-based assays were established using the 293 human embryonic kidney cell line. 293 cells express  $\alpha_v\beta_1$ , but little to no detectable  $\alpha_v\beta_3$  or  $\alpha_v\beta_6$ . cDNAs for  $\beta_3$  and  $\beta_6$  were transfected separately into 293 cells to generate 293- $\beta_3$  and 293- $\beta_6$  cells, respectively. High surface expression of  $\alpha_v\beta_3$  and  $\alpha_v\beta_6$  was confirmed by flow cytometry. Conditions were established for each cell line in which cell adhesion to immobilized human vitronectin was mediated by the appropriate integrin, as determined by a panel of integrin-specific, neutralizing monoclonal antibodies. Briefly, cells were incubated with inhibitor in the presence of 200uM  $Mn^{2+}$ , allowed to adhere to immobilized vitronectin, washed, and adherent cells are detected endogenous alkaline phosphatase and para-nitrophenyl phosphate. An 8-point dose-response curve using either 10-fold or 3-fold dilutions of compound was evaluated by fitting a four-parameter logistic, nonlinear model (using SAS).

To evaluate compound potency for membrane-bound  $\alpha_v\beta_6$  an additional cell-based adhesion assay was established using the HT-29 human colon carcinoma cell line. High surface expression of  $\alpha_v\beta_6$  on HT-29 cells was confirmed by flow cytometry. Conditions were established in which cell adhesion to immobilized human latency associated peptide (LAP) was mediated by the  $\alpha_v\beta_6$ , as determined by a panel of integrin-specific, neutralizing monoclonal antibodies. Briefly, cells were incubated with inhibitor in the presence of 200uM  $Mn^{2+}$ , allowed to adhere to immobilized LAP, washed, and adherent cells are detected by quantifying endogenous alkaline phosphatase using para-nitrophenyl phosphate. An 8-point dose-response curve using either 10-fold or 3-fold dilutions of compound was evaluated by fitting a four-parameter logistic, nonlinear model (using SAS). The compounds evaluated were relatively ineffective at inhibition of  $\alpha_v\beta_6$ -

mediated cell adhesion. The selective antagonism of the  $\alpha_v\beta_3$  integrin is viewed as desirable in this class of compounds, as  $\alpha_v\beta_6$  may also play a role in normal physiological processes of tissue repair and cellular turnover that routinely occur in the skin and pulmonary tissues.
